K-Patents Process Refractometer PR-23-GP sensor is factory calibrated to measure refractive index $n_\circ$ and temperature $T$ in standard units. Each sensor has identical calibration $n_{\circ} = 1.32...1.53$ (corresponding to 0-100 Brix). One or two sensors can be connected to one Indicating transmitter.

Because the PR-23 sensors have identical calibration, and each sensor gives Refractive Index $n_\circ$ and temperature as output, all sensors can be freely interchanged without any inconvenience of optical calibration or parameter changes.

The non-linear conversion from refractive index to concentration units and also temperature compensation are based on standard tables. They are programmed inside the transmitter independently of the sensor.

K-Patents' manufacturing process is ISO 9001 certified. K-Patents also supports the verification within the user's own quality system.

Each sensor is provided with a calibration certificate comparing a set of standard liquids to the actual sensor output. Therefore, the calibration and accuracy can be easily verified on-site with the certified refractive index liquids and K-Patents documented verification procedure.
DIGITAL MEASUREMENT PRINCIPLE

The light source emits light at the interface, between a prism and the process solution, where the rays meet the surface at different angles. Depending on the angle, some rays undergo a total internal reflection. The rest of the light is refracted into the process solution. Thus an optical image with a dark sector and a light sector is created.

The light source
Prism
Process medium

The angle corresponding to the shadow line is called the Critical Angle of Total Reflection. The Critical Angle is a function of the refractive index and therefore the concentration of the solution.

The diagnostics program ensures that the measurement is reliable.

OPERATION

K-Patents Process Refractometer PR-23-GP provides truly accurate means for measuring liquid concentrations and Brix in various process applications. The K-Patents PR-23-GP determines the concentration of dissolved solids by making an optical measurement of a solution’s refractive index.

The measurement accuracy is not influenced by particles, bubbles, sugar crystals, seeds, fibres, colour or temperature changes in the process medium. The K-Patents PR-23-GP does not require any recalibration or regular maintenance.

DATA LOGGING VIA ETHERNET

K-Patents PR-23-GP includes an Ethernet based communications solution which allows connection to computer networks (LAN) and to the Internet. Real-time measurement data and diagnostic information may be obtained through this interface, and this makes it also a valuable service tool for parameter changes and software updates.

Only a cross-over cable and data acquisition software are needed for collecting the data from a PR-23 refractometer. The communication is built on standard protocols (UDP/IP) and K-Patents offers ready-to-install software for data acquisition.

The K-Patents data acquisition software is expandable in case the user wants to modify the program. The program is written in Java and thus system independent. It can be tailored to almost any computing environment.
CORE-Optics (Compact Optical Rigid Element)

All measuring components (light source, prism, temperature sensor and CCD-camera) are in one solid CORE-optics module.

The patented CORE-optics is mechanically isolated from the influence of external forces and vibrations. The CORE-optics contains no mechanical adjustments.
